Hardware Description Language

- A high-level programming language offering special constructs to model microelectronic circuits
  - Describe the operation of a circuit at various level of abstraction
    - Behavior
    - Function
    - Structure
  - Describe the timing of a circuit
  - Express the concurrency of circuit operation

Verilog Module

module name declaration

I/O definition

module functionality

```
module smux(out, a, b, sel);
output out;
input a,b,sel;

assign out = (a&sel) | (b&(~sel));

endmodule
```

Verilog Testbench

module name declaration

I/O definition

module instantiation

apply stimulus

```
module test_smux;

wire OUT;
reg A,B,SEL;

smux U0(.out(OUT),.a(A),.b(B),.sel(SEL));

initial
begin
  A=0;B=0;SEL=0;

Verilog Simulation

Event Simulation of a Verilog Model

- Compilation
  - Compilation and elaboration
- Initialization
  - Initialize module parameters
    - Set other storage element to unknown (X) state
      - Unknown or un-initialized
    - Set undriven nets to the high-impedance (Z) state
      - Tri-state or floating
- Simulation

Example 1 (1/3)

$$f_1 = x'y'z + xy'z' + xyz$$
$$= m_1 + m_4 + m_7 = \sum(1,4,7)$$

Create a New Vivado Project

This wizard will guide you through the creation of a new project.

To create a Vivado project you will need to provide a name and a location for your project files. Next, you will specify the type of flow you'll be working with. Finally, you will specify your project sources and choose a
